The color is a pure shell-pink, stronger stems than in the Giants of California, and unusually long, while no disbudding is necessary due to the non-lateral habit.

CALCEOLARIA HYBRIDA

"Multiflora Nana"

A late German introduction of medium dwarf growth. Modern fashion often prefers small and rich flowering plants to those with larger blooms. Cineraria Multiflora Nana swept all before it and there is no reason why Calceolaria Multiflora Nana should not do likewise. The average size of the blooms is only 1-1/2 inches, but the amount of flowers produced is unsurpassed. The color schemes are extraordinarily gay and full of contrast. The yellow shades, lemon, gold, orange, are adorned with fine brown spots. The brown, orange copper, copper brown, copper scarlet, crimson and scarlet shades are very striking. An assorted group of these shades is most effective, while a single specimen 10-12 inches high, makes an ideal market plant.

PETUNIAS

These offerings, produced by the World's leading Petunia Specialists, are worthy of most careful consideration. Especially the Fringed, Ruffled and Double types, which were matured under glass on pot grown plants by hand pollination. This insures purity of strain and true reproduction of the parent plant, not otherwise so uniformly obtainable from field plantings. The slightly higher cost of these strains is offset many-fold by the high percentage of germination and beautiful specimen plants obtained. Unsolicited letters of commendation continue to reach us from customers throughout the country and we feel confident that a trial order will reflect in your continued patronage.

Oranienburg Strain.....(Developed by the Institute for Researches and Teaching of Gardening at Oranienburg-Luisenhof, Germany under the direction of Dr. Boehnert) Originator's description:

"The color of the blossoms is a vivid violet, indescribably beautiful in the wintry sun. The yellow centers set off advantageously from the other part of the blossom petals. The form of the blossom is also a remarkable one; it can be called a near approach to that of the Primula Obconica. Also, the long and thin stems have vanished; this strain producing thicker stems, which lowers the position of the large and extra fine blossom heads."
